

**DESCRIPTION OF REPLICATION PROGRAMS THAT ACCOMPANY PAPER:
Reis, Ricardo (2009) "A Sticky-Information General-Equilibrium Model for Policy
Analysis." In: Monetary Policy under Uncertainty and Learning, edited by K.
Schmidt-Heubel and C. Walsh, Central Bank of Chile: forthcoming, 2009.**

Written by: Ricardo Reis, 26 January 2009.

All of the programs were written for Matlab version 7.

1. REPLICATION INSTRUCTIONS

First, you must obtain the suite of estimation files for this class of models SIBE (sticky-information Bayesian estimation). Follow the instructions in that file to generate Chile_USGpost.mat and Chile_EMUpost.mat using the data USGdata.mat and EMUdata.mat respectively. In particular note the number of draws, chains, and so on described in the paper. (To skip this step, e-mail me for the post.mat files; they are about 70Mb each).

Next, you must obtain the suite of files to study optimal policy in this class of model SIPR (sticky-information policy rules). Put it in some directory and update the path instructions in some of the files to reflect that directory.

Finally, you can run the files: [Chile_Table1.m](#), [Chile_Tables24.m](#), [Chile_Tables35.m](#), [Chile_figures1.m](#), [Chile_figures2.m](#) to obtain all the figures and tables in the paper.

2. LIST OF ALL THE FILES

Master programs:

[Chile_Table1.m](#) has the entries in table 1.
[Chile_Tables24.m](#) has the entries in tables 2 and 4.
[Chile_Tables35.m](#) has the entries in tables 3 and 5.
[Chile_figures1.m](#) has figures 1 to 5.
[Chile_figures2.m](#) has figures 6 to 8.

Input files:

[Prior_pars.mat](#) has the prior parameters;
[Chile_###post_stats.mat](#) has the moments from the posterior distributions;
[Chile_###vardec.mat](#) has draws for the variance decomposition;
[Chile_###post.mat](#) has the posterior draws.
[USGdata.mat](#) has the USG data.
[EMUdata.mat](#) has the EMU data.

Programs called:

[Chilevd.m](#) computes the variance decomposition
[Chilevd2.m](#) computes the variance decomposition
[SIGEm.m](#) solves the model for 4 variables

`SIGEmafive.m` solves the model for 5 different variables
`SIGEmam.m` solves the model for a monetary shock.
